The program `nfssfont`

Frank Mittelbach*

2015/02/01

1 Introduction

Within the NFSS distribution there is a LaTeX file `nfssfont.tex` which can be used to test new fonts, produce font tables showing all characters, etc. This is an addaption of a program originally written by Don Knuth.

When you run this file through LaTeX you will be asked to enter the name of the font to test. Your answer should be the external font name without any extension, e.g. `cmr10` (Computer Modern Roman 10pt) or `yinit` (Yannis Haralambous' Initial font).

Alternatively (since version 2.1), you can press ⟨*return*⟩ at this point. In that case a dialog is started that asks you for the font characteristics in NFSS notation, i.e., first for the encoding scheme (default `T1`), then for the family name (default `cmr`), then for the series (default `m`), then for the shape (default `n`), and finally for the size (default `10pt`).

You are then requested to enter a command. Probably the most important one is `\table`, which will produce a font chart. To switch to a new test font, type `\init`; to finish the test, type `\bye`; and to learn about all the other possible tests type `\help`.

This is at the moment only a crude addaption of the test program for the Computer Modern fonts by Donald Knuth.

2 A driver for this document

The next bit of code contains the documentation driver file for TeX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 ⟨*driver⟩
2 \documentclass{ltxdoc}
3  % \OnlyDescription   % comment out for implementation details
4 \begin{document}
```

*Adapted from code written by Donald E. Knuth

```
    \DocInput{nfssfont.dtx}
\end{document}
⟨/driver⟩
```

3 The code

A testbed for font evaluation (see The METAFONTbook, Appendix H) changed for LaTeX with NFSS.

This program should get a complete rewrite some day or at least some code documentation. Any volunteers?

```
⟨*code⟩
\documentclass{article}
\nofiles
\setlength\textwidth{470pt}
\setlength\oddsidemargin{0pt}
\addtolength\textheight{7\baselineskip}
\addtolength\topmargin{-3\baselineskip}

\def\sevenrm{\fontencoding{OT1}\fontsize{7}{9pt}\rmfamily}

\typeout{*********************************************}
\typeout{* NFSS font test program version <\nfssfontfileversion>}

\hyphenpenalty=200
\doublehyphendemerits=30000

\newcount\m \newcount\n \newcount\p \newdimen\dim
\chardef\other=12

\def\today{\ifcase\month\or
  January\or February\or March\or April\or May\or June\or
  July\or August\or September\or October\or November\or December\fi
  \space\number\day, \number\year}
\def\hours{\n=\time \divide\n 60
  \m=-\n \multiply\m 60 \advance\m \time
  \twodigits\n\twodigits\m}
\def\twodigits#1{\ifnum #1<10 0\fi \number#1}
```

We first ask for a real external font name...

```
\def\init{%
 \typein[\currfontname]%
   {Input external font name, e.g., cmr10^^J%
    (or <enter> for NFSS classification of font):}%
```

If the answer is a real font name (like "cmr10") then we have no idea what the encoding of this font is, so in this case we record the word "unknown" and internally assume `T1` encoding. Commands other than `\table` are then most likely going to fail, unless that assumption was correct.

```
\def\encoding{unknown}%
\fontencoding{T1}\selectfont
```

If the user answers with "return" we ask for the NFSS classification of the font in form of encoding, family, series, shape, and size offering a default each time.

```
\ifx\currfontname\empty
 \typein[\encoding]{^^J^^J*** NFSS classification
                    ***^^J^^JFont encoding [T1]:}%
 \ifx\encoding\empty
  \fontencoding{T1}%
  \def\encoding{T1}%
 \else
```

Depending on the chosen encoding we have the problem, that the encoding support information may not be available (only for `T1` and `OT1` this is preloaded in the kernel, all other encodings normally need a declaration in the preamble). So here we attempt to load this support file even though it is actually already too late for this.

```
    \edef\next{%
      \lowercase{\def\noexpand\next{\encoding enc.def}}}%
    \next
    \makeatletter
    \InputIfFileExists\next
       {}%
```

If the encoding support file is not found this may indicate an error, eg something misspelled. However, it may equally mean that we dealing with a math font encoding for which no encoding support is available.

```
       {\PackageWarningNoLine{nfssfont}%
        {Encoding file `\next' not found.%
          \MessageBreak
           You might have misspelt the name of the encoding
          \MessageBreak
           or perhaps this encoding is not a text encoding,
         \MessageBreak
           in which case you will probably only be able to
         \MessageBreak
           run the \noexpand\table command successfully}%
```

But actually the situation is even worse, as some math encodings do have such support files. So for them we need to make the encoding known to NFSS in some other way, otherwise we could not even find the external font name, let alone typesetting a `\table`.

```
       \expandafter\let\csname T@\encoding\endcsname\empty
       }%
    \makeatother
    \let\next\relax
    \fontencoding\encoding
 \fi
 \typein[\family]{Font family [cmr]:}%
```

```
  \relax
  \ifx\family\empty
    \fontfamily{cmr}%
  \else
    \fontfamily\family
  \fi
  \typein[\series]{Font series [m]:}%
  \ifx\series\empty
    \fontseries{m}%
  \else
    \fontseries\series
  \fi
  \typein[\shape]{Font shape [n]:}%
  \ifx\shape\empty
    \fontshape{n}%
  \else
    \fontshape\shape
  \fi
  \typein[\size]{Font size [10pt]:}%
  \ifx\size\empty
    \fontsize{10}{10}%
  \else
    \fontsize\size\size
  \fi
```

Finally select the font and assign it to `\currfontname`.

```
  \selectfont\edef\currfontname{\fontname\font}%
 \fi
 \startfont
 \message{Now type a test command (\string\help\space for help):}}

\def\startfont{\font\testfont=\currfontname

On November 14, 1885, Senator \& Mrs.~Leland Stanford called together
at their San Francisco mansion the 24~prominent men who had been
chosen as the first trustees of The Leland Stanford Junior University.
They handed to the board the Founding Grant of the University, which
they had executed three days before. This document---with various
amendments, legislative acts, and court decrees---remains as the
University's charter.  In bold, sweeping language it stipulates that
the objectives of the University are ``to qualify students for
personal success and direct usefulness in life; and to promote the
publick welfare by exercising an influence in behalf of humanity and
civilization, teaching the blessings of liberty regulated by law, and
inculcating love and reverence for the great principles of government
as derived from the inalienable rights of man to life, liberty, and
the pursuit of happiness.'' \moretext

The redefinition of `\typeout` around the `\begin{document}` prevents LaTeX from reporting that there is no `.aux` file. This is a bad hack, I agree :-)

```
\let\oldtypeout\typeout
\def\typeout#1{}
```

And another bad hack: to be able to load an encoding definition file after `\begin{document}` I disable the preamble only setting.

```
